

PHASE V – Project Developement

Date	07 APRIL 2026
Team ID	69c378a771a975a7e423b048
Project Name	Streamlining Ticket Assignment for Efficient Support Operations
Maximum Marks	4 Marks

Objective

Phase 5 focuses on the actual implementation of the automated ticket assignment system in ServiceNow. This phase translates all planning, architecture, and logic into a working solution, ensuring that tickets are automatically routed, notifications are triggered, and SLAs are tracked effectively.

The goal is to develop a fully functional system that reduces manual intervention, increases efficiency, and improves the overall support operation workflow.

Development Process

1. Environment Setup

- Set up a **ServiceNow developer instance**
- Create **users, roles, and support groups** (Network, Hardware, Software teams)
- Configure **tables** for incidents, users, groups, and SLA tracking

2. Rule Configuration

- **Assignment Rules**
 - Automatically route tickets based on category, priority, and location
- **Data Lookup Rules**
 - Auto-populate fields such as Assignment Group, Impact, and Urgency

- **Business Rules (Optional)**

- For advanced logic or exceptions not covered by standard rules

3. Workflow & Automation

- Design **Flow Designer workflows** for:
 - SLA start and monitoring
 - Email and platform notifications
 - Escalation if SLA is breached
- Integrate rules and workflows to ensure smooth end-to-end automation

4. User Interface

- Configure **Service Portal / native UI** for ticket submission
- Ensure dashboards are set up for agents and managers to monitor ticket statuses and SLAs

5. Testing & Validation

- Perform **unit testing** for each assignment rule and workflow
- Conduct **integration testing** to ensure all components work together
- Test with multiple scenarios:
 - High, medium, and low priority tickets
 - Different categories (Network, Hardware, Software)
 - SLA triggers and notifications

6. Documentation

- Capture screenshots of configuration and workflows
- Document **phase-wise process** in GitHub Markdown files
- Include diagrams of architecture, logic, and workflow

Outcome

At the end of Phase 5, the system is fully operational. Tickets are automatically assigned to the correct teams based on category, priority, and location. Notifications and SLA tracking are active, reducing manual effort, improving efficiency, and ensuring timely resolution. The project development phase completes the transition from planning and design to a working solution that can be deployed for real-time support operations.

ServiceNow-Based Development Details

Instance Setup

- A **ServiceNow Developer Instance** is created via the ServiceNow Developer Portal.
- Roles and groups are configured:
 - **Users** – End-users submitting tickets

- **Assignment Groups** – Network, Hardware, Software Teams
- **Administrators** – For managing rules and workflows

Data Structure

- **Incident Table** – Stores ticket details such as category, priority, and status.
- **User Table** – Contains user information (requester, contact details).
- **Group Table** – Stores assignment groups and members.
- **SLA Table** – Tracks time-based targets for ticket resolution.

Assignment Rules

- Assignment rules are created in **ServiceNow ITSM** to automatically route tickets.
- Example:
 - If Category = Network → Assign to Network Group
 - If Priority = High → Trigger Immediate Notification

Data Lookup Rules

- Used to auto-populate fields like Assignment Group, Impact, and Urgency.
- Example: When a ticket is submitted, the system auto-fills the Assignment Group based on Category.

Flow Designer / Workflows

- A **Flow Designer** workflow is built for end-to-end automation:
 1. Ticket created → validate fields
 2. Evaluate Assignment Rules → assign to correct group
 3. Auto-fill fields using Data Lookup Rules
 4. Start SLA timer
 5. Trigger notifications to agent and user
 6. Escalate if SLA breached

Service Portal Configuration

- The **Service Portal** is customized for easy ticket creation.
- Users can submit tickets with minimal inputs while critical fields are auto-populated.
- Dashboards provide real-time insights for managers and agents.

Testing in ServiceNow

- Sample tickets are created for different categories and priorities.
- Check if:
 - Tickets are assigned correctly
 - SLA timers start automatically
 - Notifications reach assigned agents
- Errors or misassignments are debugged using **System Logs** and **Flow Designer logs**.

Documentation

- Screenshots of Assignment Rules, Data Lookup Rules, Workflows, and Dashboards are captured.
- Step-by-step process is documented for GitHub repository.

In Phase 5, the focus is on the actual development and implementation of the automated ticket assignment system in ServiceNow. This phase involves configuring the ServiceNow environment, setting up users, roles, and support groups, and creating tables for incidents, users, and SLA tracking. The core of the development includes designing and implementing assignment rules, data lookup rules, and Flow Designer workflows to ensure tickets are routed correctly, notifications are sent, and SLA monitoring is automated.

The Service Portal or native UI is configured to allow seamless ticket submission, while dashboards provide real-time visibility to agents and managers. Testing is conducted to validate the functionality of assignment rules, workflows, and SLA triggers across different scenarios, ensuring reliability and accuracy.

Comprehensive documentation, including screenshots, diagrams, and explanations, is also prepared to capture the development process.

By the end of this phase, the system is fully operational, reducing manual effort, improving efficiency, and enabling timely resolution of tickets while enhancing overall support operations.

THANK YOU....
