

PHASE IV – Project Demonstration and Documentation

Date	07 APRIL 2026
Team ID	69c378a771a975a7e423b048
Project Name	Streamlining Ticket Assignment for Efficient Support Operations
Maximum Marks	4 Marks

Objective

Phase 6 is the culmination of the project where the fully developed automated ticket assignment system in ServiceNow is demonstrated, tested, and documented. This phase ensures that the system is fully operational, aligns with the user and business requirements defined in earlier phases, and that every configuration, workflow, and logic is properly captured for deployment, maintenance, and replication. The main goals of this phase are to

- Validate the functionality of automated ticket routing.
- Demonstrate SLA tracking and notifications.
- Provide detailed documentation for developers, administrators, and stakeholders.
- Ensure that the system is understandable, maintainable, and scalable.

Project Demonstration

1. Ticket Submission and Validation

- Users submit tickets using the **ServiceNow Service Portal** or native UI.
- Mandatory fields include **Category**, **Priority**, **Description**, and optionally **Location**.
- Validation ensures no field is left empty and that values follow predefined rules (e.g., category must match available support groups).
- Auto-population occurs through **Data Lookup Rules**, reducing manual entry errors.

2. Automated Assignment

- **Assignment Rules** automatically evaluate ticket attributes and assign the ticket to the correct support group:
 - Category = Network → Assign to Network Team
 - Category = Hardware → Assign to Hardware Team
 - Category = Software → Assign to Software Team
- Tickets with high priority trigger immediate alerts to assigned agents.
- SLA timers start automatically once a ticket is assigned, ensuring compliance and accountability.

3. Workflow and Automation Using Flow Designer

- **Flow Designer** is configured to automate the end-to-end ticket lifecycle:
 1. Ticket submission → validation of all required fields.
 2. Rule evaluation → assignment to the appropriate group.
 3. Auto-population of related fields using Data Lookup Rules.
 4. Start SLA tracking automatically based on priority.
 5. Trigger notifications to the assigned agent and the ticket requester.
 6. Escalation workflow triggers if SLA deadlines are at risk.
- Workflows are visually represented in ServiceNow and allow administrators to modify logic without scripting.

4. Real-Time Monitoring and Dashboards

- Dashboards are set up for **agents, teams, and managers**:
 - Agents can see tickets assigned to them, sorted by priority and SLA status.
 - Managers can monitor overall team workload, SLA compliance, and ticket status metrics.
 - Escalated tickets are highlighted for immediate attention.
- Performance reports are generated automatically, showing metrics such as:
 - Average resolution time
 - SLA compliance percentage
 - Number of reassignments

5. Testing and Validation

- **Unit Testing:** Each assignment rule and workflow is tested individually to ensure proper functionality.
- **Integration Testing:** Ensures all rules, data lookup processes, and workflows operate together without conflict.
- **Scenario Testing:** Multiple tickets are submitted with different categories, priorities, and locations to validate correct routing, notifications, and SLA tracking.
- **Error Handling:** Any misrouted or unassigned tickets are analyzed using **ServiceNow System Logs** to debug configuration issues.

Documentation

1. System Configuration Documentation

- Step-by-step guide on how **Assignment Rules**, **Data Lookup Rules**, and **Flow Designer Workflows** are created and configured.
- Screenshots of tables (Incident, User, Group, SLA) with sample data.
- Documentation of user roles, groups, and permissions required for proper system functioning.

2. Process Flow and Architecture Diagrams

- Workflow diagrams showing ticket submission → validation → automated assignment → notifications → SLA tracking → resolution.
- Architecture diagrams showing **Presentation Layer (UI)**, **Application Layer (Rules & Workflows)**, and **Data Layer (Tables and SLA tracking)**.

3. User Guides

- **For End Users:** How to submit a ticket, check status, and understand notifications.
- **For Agents:** How to view assigned tickets, update ticket status, and handle escalations.
- **For Managers:** How to monitor team performance, view dashboards, and ensure SLA compliance.

4. Project Summary and Key Outcomes

- The automated system reduces **manual ticket assignment** and human errors.
- SLA compliance and notifications ensure tickets are handled within required timelines.
- Dashboards provide **real-time visibility** for all stakeholders.
- System is **scalable**, allowing additional categories, rules, or groups to be added easily.
- Documentation ensures that the system can be **replicated, maintained, and extended** for future improvements.

Example Demonstration Scenarios in ServiceNow

1. High-Priority Network Ticket

- Category: Network
- Priority: High
- Expected: Immediate assignment to Network Team, SLA starts, notification sent to agent and requester.

2. Medium-Priority Hardware Ticket

- Category: Hardware
- Priority: Medium
- Expected: Standard assignment to Hardware Team, SLA starts, agent notification.

3. Low-Priority Software Ticket

- Category: Software
- Priority: Low
- Expected: Queued assignment, SLA starts, notifications sent appropriately.

4. Escalation Scenario

- SLA threshold about to breach

- Flow Designer automatically escalates the ticket to higher-level manager.

Phase 5 Deliverables

- Fully functional ServiceNow instance with automated ticket routing.
- Configured assignment rules, data lookup rules, and workflows.
- Real-time dashboards for agents, teams, and managers.
- Tested system with various ticket categories, priorities, and SLA scenarios.
- Complete documentation including screenshots, workflows, tables, and diagrams.
- GitHub repository updated with Markdown files covering all project phases.

Phase 6 focuses on demonstrating the fully developed automated ticket assignment system in ServiceNow and documenting every step for deployment, testing, and future reference. In this phase, users submit tickets through the Service Portal or native UI, where mandatory fields such as category, priority, and description are validated.

Assignment Rules automatically route tickets to the correct support group, while Data Lookup Rules auto-populate related fields like Assignment Group, Impact, and Urgency.

Flow Designer workflows handle SLA tracking, notifications, and escalations, ensuring high-priority tickets are addressed immediately. Dashboards provide real-time visibility for agents and managers, enabling monitoring of workloads, SLA compliance, and ticket status.

Multiple testing scenarios are conducted to validate the system's accuracy, efficiency, and reliability. Comprehensive documentation, including screenshots, tables, workflows, and architecture diagrams, captures the full development and demonstration process.

By the end of this phase, the system is fully operational, scalable, and ready for deployment, offering faster ticket resolution, reduced manual effort, and enhanced service quality.

Key Points / Highlights:

- **Ticket Submission:** Users submit tickets through ServiceNow Service Portal or native UI.
- **Assignment Rules:** Automatic routing based on category, priority, and location.
- **Data Lookup Rules:** Auto-fill fields like Assignment Group, Impact, and Urgency.
- **Flow Designer Workflows:** Automate SLA tracking, notifications, and escalation.
- **Dashboards:** Real-time visibility for agents, teams, and managers.
- **Testing:** Unit, integration, and scenario testing for different ticket types.
- **Error Handling:** Debugging using system logs for misassigned tickets.
- **Documentation:** Screenshots of rules, workflows, tables, and architecture.
- **Demonstration Scenarios:** High, medium, and low priority tickets; SLA breach escalation.
- **Outcome:** Fully functional, automated, scalable, and documented system ready for deployment.

THANK YOU.....
